

Building and automated testing of a real estate website in Thai Nguyen province

Nguyen Van Son

Abstract: In the context of the increasingly developing real estate market, building an automated system to manage and display information about real estate projects in Thai Nguyen province has become necessary. This project aims to build a professional website with easy administration functions for investors and customers, as well as improve the efficiency of accessing real estate information in the province. The research method combines information technology project management theory and application deployment experimentation. The expected result is to provide an optimal solution for managing and trading real estate, contributing to the sustainable development of the real estate industry in Thai Nguyen.
