

Developing a system to support the storage and management of electronic medical records.

Dong Minh Tam

Abstract: In the context of increasingly advanced healthcare, the issue of storing and managing electronic health records (EHR) has become urgent. This project aims to build an effective electronic health record management system to improve the quality of healthcare services. The research methodology includes needs assessment, system architecture design, and experimental deployment. The project is expected to provide an integrated, secure, and convenient solution for patients and healthcare providers, thereby contributing to the development of information technology in the medical field.

Keywords: Electronic medical record management system, information security, healthcare
