

Research on some methods of application performance testing

Phan Thị Thủy

Abstract: This topic aims to review and evaluate application performance testing methods to meet the need for performance optimization in real-world environments. Through the synthesis of theory and experimental implementation, the goal is to identify the most suitable methods for each specific situation. The research results are expected to provide a foundation for software developers to improve the quality of their products and contribute to the overall development of the information technology field.

Keywords: Performance testing, testing methods, practical application, performance optimization, software development
