

Building a pesticide lookup app to serve agricultural development in Thai Nguyen province.

Nguyen Van Trung

Abstract: In the context of increasingly developing agriculture in Thai Nguyen province, the effective management and use of plant protection products (PPPs) has become an important issue. This study aims to build a mobile application to quickly and accurately look up information on various types of PPPs, thereby contributing to improving the productivity and quality of agricultural products. The research method combines existing data collection with experimentation to ensure the reliability of the application. It is expected that the application will bring significant benefits in supporting farmers as well as organizations related to the field of PPPs.
