

Building a Technology Website _ TechShop

Duong Van Tuc

Abstract: In today's digital age, the necessity of a professional technology website like TechShop to showcase products and services is undeniable. This project focuses on building a web system that meets the requirements of multimedia content management and high interactivity. The research method combines theories of modern website design with practical system deployment based on an open-source platform. The project's objective is to create an efficient, user-friendly, and customizable technical solution for technology enterprises. The expected outcome is that building TechShop will not only provide users with a better browsing experience but also contribute to the development of the local information technology industry.
