

Building an online shopping application on mobile devices

Luong Van Tung

Abstract: In the context of modern life, the use of mobile phones for commercial transactions is increasingly common. This topic aims to address the lack of smart and convenient mobile shopping applications, thereby building an online shopping application system on mobile devices. Using a combination of theoretical research and empirical methods, this topic focuses on developing a user-friendly and efficient interface while optimizing the shopping experience for end users. The expected result is a flexible and reliable mobile application solution, making a significant contribution to the development of mobile e-commerce.

Keywords: Online shopping application, Mobile device, E-commerce
