

Building sales management software

Bui Quoc Anh

Abstract: In the increasingly developing business context, it is necessary to apply technology to optimize the sales management process. This project aims to build an effective sales management software system, providing automation solutions for activities such as ordering, payment, and inventory tracking. The research method combines analyzing real-world requirements and implementing source code to release the final product. The expected result is a software system that not only helps businesses improve performance but also opens new directions for sales management through technology.

Keywords: Management software, sales automation, online business, application development, inventory management
