

Build a course registration website

Dao Thi Hue

Abstract: In the current context, the use of online tools to manage and support the course registration process at universities is becoming increasingly important. This project aims to build a professional and efficient web system that allows students to easily register for courses in the shortest possible time. Through theoretical research on website design, web programming techniques, and practical testing, the project seeks to provide an improved solution for managing registration lists by academic administration departments. This result not only enhances the user experience but also contributes to the development of information technology in education.
