

Computerization of office equipment management at Bao Tin Technology Engineering Company Limited

Nguyen Thi Yen

Abstract: In the context of modernizing corporate governance, the application of information technology to the management of office equipment is an urgent requirement. This project aims to build an office equipment management system based on a digital platform, meeting the need to optimize resources and enhance work efficiency. Through empirical research combined with a modeling and data analysis approach, the project is expected to provide a comprehensive solution for Bao Tin Technology Construction Company Limited. The results of the project are not only highly applicable in practice but also make an important contribution to the development of IT management skills in the construction and technology industry.

Keywords: Signaling, office equipment management, enterprise information systems, resource optimization, corporate governance.
