

Building management of applications on the phone on the advanced Android platform

Ho Thi Quynh Anh

Abstract: This topic aims to determine the necessity of effective management of mobile applications on the Android platform. The main objective is to develop an automation system for the process of managing and optimizing applications, meeting diverse requirements regarding features and security. Through a combination of theoretical research and experimentation, the topic is expected to contribute to improving the quality of mobile services while enhancing system performance.

Keywords: Android application management, mobile optimization, management automation, mobile security, automated system
