

Testing e-commerce products on WordPress using Selenium

Ha Kim Hang

Abstract: This topic focuses on evaluating and testing the key functions of an e-commerce product built on the WordPress platform, aiming to ensure the quality and stability of the system. Through theoretical research and experimental implementation using the Selenium tool, the topic has identified limitations and potential improvements in building and testing e-commerce websites. These results not only contribute to improving product quality but also provide developers with a guide on how to effectively use the Selenium tool.

Keywords: Application testing, WordPress, Selenium, e-commerce, testing technology
