

Research on some testing techniques for website systems

Pham Minh Nguyet

Abstract: This topic aims to research and evaluate effective testing techniques for website systems. In practice, the demand for website quality testing is increasing due to the growing prevalence of online applications. The main objective is to build a framework for the website testing process, thereby proposing solutions to optimize efficiency and cost savings. The approach includes synthesizing and analyzing existing studies combined with experiments on sample web systems. The expected results will contribute to improving the quality of online services, while providing the information technology community with important guidance on how to implement effective testing.
