

Building software to manage the Thai Nguyen bus station.

Nguyen Thi Nhung

Abstract: In the rapid development of information technology, building a bus station management software is an essential need to improve operational efficiency and customer service. This topic focuses on analyzing requirements, designing the system, and deploying a software solution to support operations at Thai Nguyen bus station. The research method applies both information management theory and experimentation in the software development process. Expected results will bring significant improvements in management, while contributing to technological development in the transportation industry.
