

Identifying conversational acts in Vietnamese

Nguyen Thi Hong Nhung

Abstract: In the context of the increasing use of natural language in daily communication and information technology, identifying conversational acts has become an important issue. This project aims to study the theory and implement a system for recognizing conversational acts in Vietnamese. Through a combination of theoretical and experimental methods, the project is expected to contribute to the field of natural language linguistics and support the development of natural language processing technology. The expected results of the project will not only help improve communication quality but also open up many potential applications in automated information systems.
