

Build a website to support searching for rental rooms.

Nguyen Hong Son

Abstract: In the context of the increasing demand for rental rooms but facing many difficulties in choosing a suitable location, this topic aims to solve the problem by building a web system for searching rental rooms. Through a process of theoretical research combined with experimentation, the project will provide users with features such as searching by location, amenities, price, and landlord reviews. The goal of the topic is to create a convenient and effective solution to reduce the hardships of renting rooms, while enhancing the user experience. This breakthrough not only meets practical needs but also contributes to the development of information technology and housing services.

Keywords: Website for finding rooms for rent, information technology, boarding house management, web system, rental experience
