

Building a frame relay network system for Nam Dinh province post office.

Nguyen Trung Thanh

Abstract: This topic is carried out in the necessary context of improving the information network infrastructure at Nam Dinh Provincial Post Office. The main objective is to build and deploy a Frame Relay network system to optimize data transmission performance between points in the area, thereby enhancing service quality for customers. Through a process of theoretical research combined with experimentation, the topic will determine the optimal parameters of the system and propose suitable technical solutions. The expected result is to provide a modern, flexible network platform for Nam Dinh Provincial Post Office to access advanced technology and compete in the telecommunications service market.
