

Building a clothing item management application on the Android operating system

Luu Ba Thao

Abstract: This topic focuses on developing a mobile application to efficiently manage clothing items, aiming to meet the modern demands of the fashion market. Through research, design, and implementation of the application on the Android platform, the goal is to optimize product management processes in clothing business systems. The approach includes both practical analysis and application development programming. The expected outcomes of this topic not only provide an effective technical solution but also contribute to the advancement of item management technology in the fashion industry.

Keywords: Android application, Clothing item management, Fashion technology
