

Design and development of a graduation project management support tool for ICTU students

Nguyen Kim Thinh

Abstract: In university teaching practice, managing Capstone Projects for Information Technology (ICTU) students is an important issue. This topic focuses on designing and building a management support tool to improve the project process. The project aims to create an intelligent system to automate the management process, thereby increasing efficiency and accuracy. The research method combines theory with experimentation, including requirements analysis, user interface design, and application deployment. The significance of the topic lies in contributing a useful solution for both students and instructors, supporting them in the process of completing their graduation projects.
