

Build a restaurant food ordering application

Luong Quoc Tiep

Abstract: In the context of increasing demand for ordering food at restaurants, this topic aims to solve the problem of order management and enhance customer experience by building a mobile application. The objective of the research is to design and implement an online ordering system for restaurants, based on a combination of theoretical research on mobile application development technology and experimentation to ensure efficiency and suitability for the specific needs of restaurants. Through this, the topic hopes to contribute to the development of the culinary industry while creating economic value for restaurants using the application.

Keywords: mobile application, order management, customer experience
