

Building a Frame relay network system model for Thai Nguyen province post office.

Hoang Tuan Anh

Abstract: This topic focuses on building and deploying a Frame Relay network system model to serve the information needs of the Thai Nguyen Provincial Post Office. Given the rapid development of technology, applying Frame Relay to enhance operational efficiency and meet the large connection requirements between local transit points is necessary. Through theoretical and experimental research, the topic will analyze the existing network structure, identify technical factors to optimize the Frame Relay system, and thereby build a solution suitable for the specific circumstances of the Thai Nguyen Provincial Post Office. The expected results provide a solid foundation for improving the technical infrastructure and enhancing service quality at the unit.
