

Building a network system for the post office of Hoa Binh province.

Nguyen Van Quang

Abstract: This topic aims to meet the need for modernizing the goods and information transport network of Hoa Binh province's post office by building an efficient network system. Through a process of theoretical research combined with experimentation, the topic will identify optimal solutions for warehouse management and improve labor productivity at the local post office. The expected results will bring significant improvements in organizing and operating the post office's activities, while contributing to the sustainable development of the telecommunications and delivery industry.

Keywords: Network system, Hoa Binh Province Post Office, Warehouse management, Performance optimization, Telecommunications technology
