

Building land management software for HTT real estate company on a Web platform

Nguyen Duy Hung

Abstract: In the context of an increasingly developing real estate market, effective management of land resources plays a crucial role. This topic focuses on building a land management software for HTT Real Estate Company on a Web platform with the goal of optimizing the process of using and monitoring land information. Through a combination of theoretical research and experimentation, the topic aims to provide advanced technical solutions that meet the modern management needs of the enterprise. The expected results will significantly contribute to improving the operational efficiency and competitiveness of HTT Real Estate Company.

Keywords: Land management, Web software, information technology, real estate, business administration
