

Building the Lewcher application on the Android platform

Duong Tuan Canh

Abstract: This topic focuses on developing a mobile application based on the Android platform named Lewcher, meeting user needs in the field of personal information management and communication. Through theoretical research combined with experimentation, the goal is to build a system that improves the efficiency of information usage and enhances user experience. The applied method includes designing and deploying the application according to modern digital principles. The expected results will contribute to promoting the development of mobile technology in practice, while creating a useful solution for users.

Keywords: Android application, Lewcher, Personal Information Management
