

Build a Homestay booking website

Le Cong Nam

Abstract: In the context of an increasing number of tourists choosing homestays as their accommodation, building a homestay booking website has become a useful solution. This project aims to develop a web system that allows homeowners to register, manage, and market their properties; while providing tourists with convenient online booking services. Through theoretical and experimental research, the project has applied modern programming techniques to build a user-friendly interface and effective website administration functions. The expected results will contribute significantly to the development of local community-based tourism.

Keywords: booking website, homestay, web management system, application programming, community tourism
