

Building a food ordering application on the Android operating system

Tran Xuan Oai

Abstract: In the context of the rapid development of information technology, accessing daily services via mobile phones has become increasingly common. This project focuses on building a food ordering application on the Android platform to optimize the process of selecting and purchasing food at restaurants. The goal of the project is to develop a simple, efficient system for customers to easily search, order, and pay online. Through theoretical research and practical application deployment, the project aims to address the lack of convenient food ordering utilities on Android. The expected results will contribute to the development of mobile programming skills while meeting user needs in the modern digital world.
