

Building software for managing and evaluating personnel at the software development company ByteSoft.

Nguyen Duy Quang

Abstract: In the increasingly fierce competitive landscape of the information technology market, building an effective personnel management and evaluation system plays a key role in enhancing work productivity. This project aims to design and implement a personnel management software for ByteSoft Software Development Company, with main functions such as tracking work charts, performance evaluation, and employee database management. The research methodology is based on a combination of a quick survey of the current business practices and an analysis of similar software solutions on the market. The expected outcome of this project is a specialized personnel management system that contributes to increasing work performance and optimizing human resources.
