

Building an online sales management website for mobile phones and accessories for a Mobile store.

Nguyen Phan Quoc

Abstract: This topic focuses on building a web-based management system for online sales of mobile phones and accessories, meeting the needs of businesses in the information technology sector. Through a thorough study of the market context, the topic identifies the main goal of creating a comprehensive solution to optimize sales processes and inventory management. The approach combines customer needs analysis with the deployment of modern technologies such as web programming. The expected outcome of the topic is not only an easy-to-use system but also a significant contribution to the sustainable development of the mobile retail industry, enhancing the shopping experience for end users.
