

Building an order placement system for restaurants on the Android operating system

Ha Van Tin

Abstract: This topic focuses on building an online ordering system for restaurants, aiming to meet the demand for technology in the food service industry. Through research and practical analysis, the topic identifies the main goal of developing a mobile application on the Android platform so that users can easily select food, place orders, and make online payments. The research method combines theory on mobile application system design with practical construction techniques. The system is expected to provide a convenient solution for restaurants and customers, while enhancing the service experience in the food industry.
