

Building an English learning support application on Android

Nguyen Thi Hoa

Abstract: In the context of the increasing demand for learning foreign languages to enhance communication skills and expand personal and professional opportunities, this topic focuses on building a mobile application to support English learning on the Android platform. The objective of the topic is to develop an automated learning system aimed at helping learners improve their listening, speaking, reading, and writing skills through practical activities and educational games. The research method combines theories of mobile application design with experiments to evaluate the learning effectiveness of users. This topic is expected to provide a useful solution for the education and training sector, while also contributing to the field of information technology serving education.
