

Building a personnel management program

Le Van Cuong

Abstract: In the current context, effective human resource management plays a crucial role in the sustainable development of organizations. This topic aims to build an automated and information-integrated human resource management system, contributing to optimizing the recruitment, evaluation, and classification of employees. The research method combines human resource management theory with experimental implementation on a modern technology platform. Through this, the topic hopes to provide a practical, highly applicable solution that can be widely adopted in enterprises.

Keywords: human resource management, automation, information integration
