

Building a raw material warehouse management program at An Quang Hung enterprise in Bac Giang province

Tran Thi Huong

Abstract: This topic focuses on building a raw material warehouse management system for An Quang Hung enterprise in Bac Giang province to improve operational efficiency and reduce logistics costs. Through theoretical and experimental research, the topic identifies specific functional requirements and deploys appropriate technological solutions. The main goal is to optimize warehouse management processes by using specialized software. Expected results will bring significant improvements in inventory control and enhance supply chain flexibility, thereby contributing to increasing the enterprise's competitiveness.

Keywords: Warehouse management, Raw materials, Information technology, Local enterprises, Process optimization
