

Create a 2D video conveying the message "Protect forest resources"

Cao Xuan Thang

Abstract: In the context of increasing loss and degradation of forest resources, this study aims to design and implement a 2D video communication solution with the goal of raising community awareness about the importance of protecting natural resources. Through a process of theoretical research combined with experimentation, the project applies modern graphic technologies to create highly persuasive video content. The expected results will effectively contribute to upgrading information systems and educating the community on forest protection.

Keywords: Forest resource protection, 2D video, social media, graphic technology, awareness raising.
