

Building a mobile travel application with Duli

Le Duc Quan

Abstract: In the context of strong tourism development, the necessity of building a mobile application to optimize the experience for tourists and support travel businesses is mentioned. This project aims to develop a mobile application system that provides useful information about destinations and local services, while also directly connecting with tourism service providers such as taxis, hotel bookings, and flight tickets. The research method combines theory with experimentation to ensure the application meets the actual needs of the market. The expected result is an effective digital solution that contributes to the sustainable development of the tourism industry.
