

Exploring streaming technology for building Web Streaming applications

Vu The Hung

Abstract: This topic focuses on researching and applying streaming technology to improve the quality of user experience on the Web. The objective of the research is to build a robust and efficient web streaming system that meets the diverse needs of users in practice. The approach includes analyzing existing streaming theory and implementing specific solutions to optimize the process of transmitting online content. The expected result is a flexible web streaming system that ensures stable transmission quality and meets real-time requirements, making a significant contribution to the development of multimedia communication technology.

Keywords: Web Streaming, Streaming Technology, Online Transmission System
