

Android application for building an expense management system for businesses

Tran Thi Hong Tuoi

Abstract: In corporate financial management practice, tracking and controlling expenses is an issue that cannot be overlooked. This project aims to develop a mobile application based on the Android platform to support companies in managing expenses more effectively. Through theoretical and experimental research, we have built a system that automates the process of tracking, analyzing, and reporting expenses, thereby enhancing business decision-making. The expected results will provide organizations with a powerful tool to optimize finances and improve management capabilities.
