

Building a fast payment method for online transactions

Nguyen Thi Chinh

Abstract: In the context of increasingly digitalization, the issues of speed and security in online payments have become urgent. This topic aims to build a fast and secure payment system for online transactions through the application of blockchain technology. Through a combination of theoretical research and experimentation, this topic is expected to provide a solution that optimizes customer experience while ensuring transaction security. The expected result is an efficient and reliable payment system, contributing to the development of e-commerce.

Keywords: Online payment, blockchain technology, payment system, e-commerce, information security
