

Build a FlexRestaurant restaurant website using WordPress.

Nguyễn Thị Yến

Abstract: In the context of e-commerce development, building a professional website for restaurants has become important. This topic focuses on the process of designing and implementing a content management system (CMS) based on the WordPress platform to support the online business operations of FlexRestaurant. The goal is to build a user-friendly website that is easy to update information and manage menus and online table reservations. The research method combines theory on user interface/user experience (UI/UX) design with practical application deployment on WordPress. The expected result is to provide an effective integrated solution for the restaurant to enhance customer experience and optimize service processes.
