

Building a job board transaction support system on the WordPress platform.

Pham Xuan Nhat

Abstract: This topic aims to propose a solution for building a professional Jobboard system based on the WordPress platform, meeting the requirements for managing and searching for job information. Through a combination of theoretical research and experimentation, the project aims to create a user-friendly interface along with useful features such as filtering job positions, evaluating recruiting companies, and supporting application registration. Through deployment and testing, the system is expected to provide an effective solution for both employers and job seekers, contributing to the development of the online job market.

Keywords: Job board, WordPress, job transaction management, website platform, technology application
