

Building an Online Bookstore Website using ASP.Net technology

Ngo Van Hai

Abstract: In the context of the increasingly developing digital platform, building an online book sales website system to meet consumers' demands for convenient and diverse shopping has become important. This project aims to design and implement an e-commerce system specializing in books using ASP.Net technology, combined with modern programming methods to ensure stability and efficiency. Through theoretical research and experimentation, the project hopes to provide a technical solution that can be widely applied in the online book retail sector, contributing to improving service quality and opening up new business opportunities.
