

Building an online document management and storage system based on the Laravel Framework

Nguyen Huy Hoang

Abstract: In the current digital context, building an online text management and storage system has become an essential need. This project aims to develop a solution based on the Laravel Framework to effectively meet the requirements for organization, information retrieval, and security. The research method combines theory with experimentation to ensure the system achieves high stability and is easy to upgrade in the future. The expected result is a flexible solution suitable for various text management applications, contributing to the development of online content management technology.
