

Building a culinary lookup application on the Android operating system

Nguyen Truong Son

Abstract: This topic focuses on developing a mobile application on the Android platform to support users in finding information about local dishes and eateries. The context of the topic reflects the growing market demand for digital solutions in the culinary field. The objective is to build an efficient, easy-to-use lookup system that provides accurate information about dishes and the places that serve them. The research methodology includes the process of requirements analysis, user interface design, application implementation, and experimentation. The expected outcome of the topic is not only a useful application but also a contribution to the development of mobile technology in the culinary service sector.

Keywords: Android application, Culinary lookup, Culinary information system
