

Building personal asset management software on Windows Phone

Ha Van Truong

Abstract: In the context of increasingly complex personal asset management that demands user convenience, this topic aims to address this issue by building a personal asset management software system on the Windows Phone platform. The project's goal is to create an application that helps users easily track, organize, and manage their various types of assets. The research methodology includes analyzing real-world requirements, designing a user-friendly interface, and deploying the application on Windows Phone for testing. The expected results will bring convenience and efficiency to personal asset management, while also contributing to the fields of information technology and asset management.
