

Building a system for searching and renting rooms

Bui Van Ninh

Abstract: In the context of the increasing demand for finding suitable accommodation, this topic focuses on building a search and rental system for boarding houses. The main objective is to create a solution that helps users easily find boarding house listings that match their requirements. The research method is based on a combination of data processing theory and experimentation to ensure the system's effectiveness. It is expected that the system will provide a convenient user experience for both tenants and landlords, contributing to solving the problem of finding accommodation quickly and accurately.
