

Building a patient management program at Mai Son commune health station, Luc Yen District, Yen Bai.

Vi Van Cach

Abstract: In the context of increasingly developing healthcare and the need to improve patient management efficiency at health stations, this topic focuses on building a patient information management system. The objective of the research is to solve the problem of organizing and managing patient information scientifically, thereby improving the quality of medical services. The implementation method includes both theoretical research on information technology and application deployment at Mai Son commune health station. The topic is expected to make a significant contribution to optimizing the workflow of medical staff and enhancing the quality of healthcare services for local residents.

Keywords: Patient management, Information technology, Health station
