

Research on biochemical analyzers and writing a program for processing biochemical test data

Phan Thị Hằng

Abstract: The topic aims to research and develop technological solutions for operating biochemical testing machines, while building a data processing system to improve performance and accuracy. Through the process of experimentation and application of modern technical methods, the topic hopes to contribute to the development of the healthcare sector by optimizing workflows and enhancing the quality of testing services.

Keywords: Biochemical testing, Testing machines, Software development, Data processing
