

Building a child health monitoring support application on Android

Nguyen Thi Lan

Abstract: Children are special subjects that require comprehensive protection and care. This project focuses on building an Android application with the main goal of supporting parents and child caregivers in monitoring children's health conveniently and effectively. Through the research process, the project combines theories of health data management with practical implementation of the application on the Android platform. The expected results will provide appropriate technical solutions to improve the quality of child care, while contributing to the development of technology in the medical field.
