

Application of webGIS technology to build an administrative information website for Thai Nguyen province

Vũ Thị Minh

Abstract: This topic aims to determine the necessity of applying webGIS technology in providing administrative information in Thai Nguyen province. The objective is to build a website system using webGIS technology to provide effective management and access services for administrative information, thereby improving the quality of services for citizens. Through a combination of theoretical research and practical implementation, the topic hopes to contribute to the development of the province's digital infrastructure, while providing a modern technology application solution in administrative governance.

Keywords: webGIS, administrative information, website, information management, Thai Nguyen province
