

Research on some sentiment classification techniques on social networks

Giap Thi Hoai Thu

Abstract: This topic focuses on researching and applying opinion classification techniques from social media data to address the modern problem of collecting opinion information from diverse sources. The research objective is to build an automated system to identify and classify opinions with high accuracy, thereby improving the efficiency of processing and analyzing social media data. The approach includes both theoretical research on opinion classification models and experimentation on large-scale datasets. The topic aims to contribute a useful solution to the field of information management, thereby supporting decision-making and effective business strategy development.

Keywords: opinion classification, social network, automation system, classification model
