

Research on WebGIS technology and building a website to support tourism for some destinations in Thai Nguyen province

Nguyen Thi Linh

Abstract: In the context of the rapid development of information technology, the application of WebGIS technology has become an effective solution to enhance the quality of tourism services. This project aims to build a tourism support website based on the WebGIS platform to help tourists easily search for information about tourist attractions in Thai Nguyen province. The research process combines theoretical and experimental methods, from analyzing existing technologies to deploying specific applications in a web environment. The project is expected to provide a comprehensive solution to support local tourism management and promotion.
