

Building a website to introduce tourist attractions in Tuyen Quang province based on WebGIS technology

Lai Thi Thuy Huyen

Abstract: This topic proposes building a website aimed at providing information about tourist destinations around Tuyen Quang province, using WebGIS technology to enhance interactivity and efficiency in data transmission. The context for selecting this topic is based on the development needs of Tuyen Quang province's tourism industry. The objective is to build a web GIS system that enhances the ability to search for tourism information effectively, while also contributing to the development of Geospatial Technology in the locality. The research method applies a combination of learning and empirical approaches to evaluate the website's performance. The significance of the topic lies not only in its practical application in tourism but also in its potential to exploit WebGIS technology, helping to improve the quality of local tourism services.

Keywords: WebGIS, Tourism, Tuyen Quang Province, Geographic Information Technology
